The Punnett square from this configuration is below. Here we see that there are three ways for an offspring to exhibit a dominant trait and one way for recessive. This means that there is a 75% probability that an offspring will have the dominant trait and a 25% probability that an offspring will have a recessive trait.

Probability and Punnett Squares. A Punnett square is a special tool derived from the laws of probability. It is used to predict the possible offspring from a cross, or mating between two parents. An example of a Punnett square (Figure below) shows the results of a cross between two purple flowers that each have one dominant factor and one recessive factor (Bb).
